

Phase 1: The "Vaporware" Launch (Hours 0-24)

Objective: Get 50 people to comment "Beta" on LinkedIn/Twitter. **Asset:** The HTML Prototype (Contextualize_MVP.html).

Step 1: Record the "Vibe" Demo (15 Minutes)

Do not show code. Show the *experience*.

1. Open `Contextualize_MVP.html` in your browser. Enter Full Screen (F11).
2. Use a screen recorder (OBS or Loom).
3. **Shot 1 (The Hook):** Start on the "Graph View". Hover over the bubbles. It looks sci-fi and smart.
4. **Shot 2 (The Problem):** Switch to the "Chat" view. Type: *"What did I save about React Server Components last week?"*
5. **Shot 3 (The Payoff):** Click enter. Let the mock loading animation play. Show the answer appearing.
6. **Length:** 30 seconds max. No audio needed, or add a chill lo-fi beat.

Step 2: The LinkedIn Post Script

Copy-paste this, tweak it to your voice, and attach the video.

Headline: I have 3,000 bookmarks and I've read... zero of them. 🤖

Body: We are all digital hoarders. We find a great article, click "Save", and it disappears into the void forever.

I got tired of having a "Write-Only Memory."

So I spent the weekend building **Contextualize.ai**.

It's a "Second Brain" that actually talks back.

1. Save any tab (articles, tutorials, GitHub repos).
2. It uses AI to read and "vectorize" the content.
3. You can chat with your library: "Synthesize these 5 articles into a blog post" or "Find that one React hook I saved 6 months ago."

It turns dead bookmarks into living insights.

I'm building this in public as a solo dev. I'm looking for 10 beta testers who are tired of drowning in open tabs.

Comment "BRAIN" below and I'll send you the invite link when the MVP drops next week.

#buildinpublic #ai #rag #webdev #productivity

Phase 2: The "Walking Skeleton" (Hours 24-48)

Once that post is up, you have "Social Debt." You *have* to build it now.

Step 1: Repo Setup

1. `npx create-next-app@latest contextualize --typescript --tailwind --eslint`
2. `npx supabase init`

Step 2: The Extension "Hello World"

Don't build the full scraper yet.

1. Set up Plasmo.
2. Make the popup button simply `console.log` the current URL.
3. *Win:* You have a button in Chrome.

Step 3: The Database "Hello World"

1. Run the SQL schema I gave you in the MVP Spec.
2. Manually insert one row into the `documents` table via Supabase Dashboard.
3. Connect your Next.js app to fetch that one row and display it.
4. *Win:* You have a Full Stack app.

Phase 3: The "Wizard of Oz" Alpha

Secret: You don't need the AI to work perfectly for the first version.

- If the "Graph View" is too hard to build with real data initially? **Fake it.** Use static data for the visual, but make the *Chat* real.
- If the Scraper breaks on some sites? **Ignore them.** Optimize for the happy path (clean blogs like Medium/Substack).

Your Goal: Get the product into the hands of those 50 commenters within 14 days.
